  Pred. No. is the number of results predicted by chance to have a
score greater than or-equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score

DNA polymerase I (EC 2.7.7.7) (POL I).
POLA OR SP0032.
                                 Science 293:498-506(2001).

-!- FUNCTION: IN ADDITION TO POLYMERASE ACTIVITY, THIS DNA POLYMERASE EXHIBITS 3' TO 5' AND 5' TO 3' EXONUCLEASE ACTIVITY.

-!- CATALYTIC ACTIVITY: N deoxynucleoside triphosphate = N diphosphate + (DNA)(N).

-!- SUBUNIT: SINGLE-CHAIN MONOMER WITH MULTIPLE FUNCTIONS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Lopez P., Martinez S., Diaz A., Espinosa M., Lacks S.A.; "Characterization of the polA gene of Streptococcus pneumoniae and comparison of the UNA polymerase I it encodes to homologous enzymes from Escherichia coli and phage Ty."; J. Biol. Chem. 264:4255-4263(1989).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       incorporation of labeled ddCTP and ddATP, is new. The modified DNA polymerase, has proofreading 3'-5' exonuclease activity during DNA sequencing from a template and the polymerase excises mismatched nucleotides from the 3' terminus at a faster rate than it removes correctly matched nucleotides. The polymerase is used particularly for DNA sequencing, also for filling in 5' overhangs, synthesis of DNA DNA sequencing, also for filling in 5' overhangs, synthesis of DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA polymerase that is modified (see AAY91930) so that during DNA sequencing, it effectively incorporates all four fluorescent dyedideoxynucleotide triphosphates (ddNTP), or their analogs, and recommendations of the contraction of the contra

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     at each cooling step. The invention contemplates single-reaction RT-PCR wherein reverse transcription and amplification are performed in a single continuous procedure. Primers, template, nucleoside triphosphates, appropriate reaction buffer having magnesium ions, reaction conditions, and polymerase are used in the PCR process, which involves denaturation of target DNA, hybridisation of primers and synthesis of complementary strands. The present sequence is Bacillus stearothermophilus (Bst) DNA polymerase 1 protein fragment which lacks 5' to 3' exonuclease activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bacillus stearothermophilus; thermostable DFT polymerase; PCR; primer; amplification; probe; Bacillus caldotenax; exonuclease; recombination; sequencing; polymerase chain reaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Reverse transcription of RNA using Tvu and Bst DNA polymerase, comprises combining the polymerase, RNA containing sample, a primer and reaction buffer having magnesium ions and reacting the mixture to
Bacillus stearothermophilus DNA encoding thermostable polymerase for nucleic acid sequencing and amplification % \left( 1\right) =\left\{ 1\right\} 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            thermostable DNA polymerase such as Thermoactinomyces vulgaris (Tvu) and Bacillus stearothermophilus (Bst) DNA polymerase. Tvu and Bst DNA polymerase are useful for reverse transcription reactions which allows repetitive heating/cooling cycles without the requirement of fresh enzyme

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
The present sequence plan sequencing, effectively DNA polymerase that, during DNA sequencing, effectively incorporates all four fluorescent dye-labeled dideoxynucleotide triphosphates (ddNTP), or their analogs, and reduces the discrimination, triphosphates (ddNTP), or their analogs, for incorporation of labeled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                gene (AAT04801) to remove a 195 bp HincII-PyuII fragment from the region encoding the 5'-3' exonuclease. The deleted fragment removes 65 amino acids (residues 178-242 of the protein) including 2 Gly residues though to correspond to 2 amino acids in the E.coli DNA polymerase I necessary for 5'-3' exonuclease activity. The modified DNA polymerase can be used in primer extension reactions such as DNA sequencing or polymerase chain
                                                                                                                                                                                                                                          Hong
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This is the amino acid sequence of the modified Bacillus stearothermophilus thermostable DNA polymerase encoded by the clone Bst3 which contains a deletion in the 5'.3' exonuclease domain. The corresp.
                                                        The present sequence shows a modified Bacillus stearothermophilus DNA polymerase that, during DNA sequencing, effectively

       The invention relates to reverse transcription of RNA templates using thermostable DNA polymerase such as Thermoactionwyces vulgaris (Tvu) and Bacillus stearothermophilus (Bst) DNA polymerase. Tvu and Bst DNA polymerase are useful for reverse transcription reactions which allows repetitive heating/cooling cycles without the requirement of fresh enzyme at each cooling step. The invention contemplates single-reaction RT-PCR wherein reverse transcription and amplification are performed in a single continuous procedure. Primers, template, nucleoside triphosphates, appropriate reaction buffer having magnesium ions, reaction conditions, and polymerase are used in the PCR process, which involves denaturation of target DNA, hybridisation of primers and synthesis of complementary extrande The PCR process, which involves denaturation of target DNA, hybridisation of primers and synthesis of complementary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ddCTP and ddATP, is new. The modified DNA polymerase, has proofreading 3'-5' exconuclease activity during DNA sequencing from a template and the polymerase excises mismatched nucleotides from the 3' terminus at a faster rate than it removes correctly matched nucleotides. The polymerase is used particularly for DNA sequencing, also for filling in 5'-overhangs, synthesis of DNA probes by random primer labeling and in
                                                                                                                                                                                                                                                                   Reverse transcription of RNA using Tvu and Bst DNA polymerase, comprises combining the polymerase, RNA containing sample, a primer and reacting buffer having magnesium ions and reacting the mixture to

                                                                                                                                     polymerases derived from hyperthermophilic eubacteria, in particular, polymerases derived from hyperthermophilic eubacteria, in particular, a purified and isolated Thermoactinomyces vulgaris (Tvu) DNA polymerase having DNA synthesis activity. It is useful for determining the nucleotide base sequence of a DNA molecule. Tvu DNA polymerase can be used for processes of high temperature nucleic acid amplification and sequencing without substantial loss of DNA synthesis activity. The enzyme can be used to perform high temperature reverse transcription in the absence of manganese ions and in high throughput robotically-manipulated procedures because greater enzymatic stability is retained at room temperature. Using the Tvu DNA polymerase, reverse transcription reactions can be conducted at increased temperatures so that secondary structure is removed or limited. The present sequence represents the amino acid sequence of a 5'-3' exonuclease deletion mutant form of the process of the present sequence and the process of the secondary structure is removed or limited. The present sequence represents the manipulant and polymerase, reverse transcription of the present sequence represents the manipulant and polymerase transcription in the secondary structure is removed or limited. The present sequence represents the manipulant and polymerase and polymerase transcription in the secondary structure is removed or limited. The present sequence represents the manipulant polymerase and polymerase transcription in the secondary security.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   polymerase T289M truncated mutant. This Tvu T289M mutant is obtained by deleting 288 amino acids from the N-terminal end of wild-type T.
                                                                                  Sequence
                                                                                                                       Tvu DNA polymerase called T289M.

                                                                                                                                                                                                                                                                          This is the protein sequence (589 amino acids) of the Bacillus stearothermophilus strain DNA polymerase. The heat stable DNA polymerase can be used in a method for the replication of a DNA chain. It can also be used in amethod for the determination of the sequence of DNA chain. As the DNA polymerase has a proof reading 3'-5' exonuclease activity, possible mismatches of base pairing that occurs in current methods of DNA sequence determination of a DNA clone can be avoided.

This clone encodes the sequence of a natural degradation product obtained when the DNA polymerase clone Bst3 (AAT04803) is expressed in E.coli. The same sequence is found when the full length clone (AAT04801) is expressed and cleaved with subtilisin to produce a "Klenow-type" DNA polymerase. This sequence starts with the Val residue at pos. 28 of the full length protein. This contrasts with a commercially available B.stearothermophilus DNA polymerase subtilisin fragment where the protein sequence starts with the Val account of the sequence starts with the Val account of the sequence starts with the NA polymerase subtilisin fragment where the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 24-FEB-1995;

at each cooling step. The invention contemplates single-reaction RT-PCR wherein reverse transcription and amplification are performed in a single continuous procedure. Primers, template, nucleoside triphosphates, appropriate reaction buffer having magnesium in reaction conditions, and polymerase are used in the PCR process, which involves denaturation of target DNA, hybridisation of primers and synthesis of complementary strands. The process sequence is Thermoactinomyces vulgaris Twu DNA polymerase M285 truncated mutant. This Tvu M285 mutant is obtained by deleting 284 amino acids from the N-terminal end of wild-type T. vulgaris

                                                                                                                                                                                                                                                                                                                               The invention provides compositions comprising thermostable DNA

Coplymerases derived from hyperthermophilic eubacteria, in particular,

Ca purified and isolated Thermoactinomyces vulgaris (Tvu) DNA polymerase

Chaving DNA synthesis activity. It is useful for determining the

Can incleotide base sequence of a DNA molecule. Tvu DNA polymerase can be

cused for processes of high temperature nucleic acid amplification and

cused for processes of high temperature reverse transcription in the

can be used to perform high temperature reverse transcription in the

can be used to perform high temperature reverse transcription in the

cused sequence of manganese lons and in high throughput robotically manipulated

cused correctures because greater enzymatic stability is retained at room

cused the transcription of temperature. Using the Tvu DNA polymerase, reverse transcription

cused to procedures because greater enzymatic stability is retained at room

cused to procedure is removed or limited. The present sequence represents the

cushon acid sequence of a 5'-3' exonuclease deletion mutant form of
